Product overview

Xperia™ SP LTE – Experience the brilliance of Sony inside and out

High definition entertainment in a premium design.

With its exquisite co-moulded aluminium frame, Xperia SP has the looks of a true design connoisseur's smartphone. The super-sharp HD screen covers almost the entire front. It stays spectacularly black when off, turns vibrantly colourful when on. This phone runs on the latest Android platform, and it's got all you need for moment-catching too. The 8 megapixel camera goes from sleep to snap in less than a second. Feel a still's not enough? Shoot scenes and scenery in beautiful HD video. You'll get a perfect result every time. It's a wrap? Then easily view it all on your TV via one-touch sharing.

Beauty well crafted

How would you define quality? Run your fingers over Xperia SP's precision-crafted co-moulded aluminium frame and you just might have your answer. To add that extra touch of you-style, try the customisable illuminations. They notify you of events, Facebook updates and more. And give that extra oomph to your music and pictures.

Closer to reality

Lost in the woods, wolfpack closing in. On the pitch, dodging that sliding tackle. Xperia SP's 4.6" HD screen is so vivid you feel you're in the middle of it all - no matter what you're viewing. The Reality Display is powered by Mobile BRAVIA® Engine 2. That means razor sharp images, vibrant colours and the enhanced contrast you recognize from Sony TV's.

Easy connectivity with one-touch functions

The NFC-enabled smartphone lets you share pictures with other phones in a single touch. Or you can touch your Xperia SP to a Bluetooth™ speaker and listen to music saved on the phone.

Share your phone screen on a TV

You can play your videos on a big screen by connecting a standard HDMI cable to your HDTV using an MHL adapter* or a compatible TV Dock* accessory. If you prefer to go wireless, you can use the Screen Mirroring** feature to share content from your phone via a TV. With the touch of a button, you can watch your selected photo pop up on the TV screen or listen to the current music track play on the TV's speakers.

Snap and shoot – anytime, any light

Getting dark? Don't let that stop you. The Exmor RS™ for mobile sensor gives you radiant pictures even in low light. No need to worry about getting the camera settings right either. Superior Auto mode helps you to that perfect picture without further ado - noise reduction is automatically activated when needed.

Music the way you want it

Ragga, grime or boy bands? With the "WALKMAN" app, you customise your music experience as you please. Create your own playlists and listen in Soul shaking clarity with Clear Audio+*** and xLoud loudness enhancement. Can't get enough? Go further into Music Unlimited and choose from millions of songs. When you've found the right track, crank it up and get the sound just right with graphic equalisers. Or connect to wireless speakers with just a touch and use your smartphone as the ultimate DJ deck.

* Separate accessory, not included.

** Your TV must support screen mirroring based on Wi-Fi CERTIFIED Miracast™ for the screen mirroring feature to work. If your TV does not support such screen mirroring, you need to purchase a wireless display adapter separately. When using screen mirroring, the image quality may sometimes be negatively impacted if there is interference from other Wi-Fi networks.

*** Requires Clear Audio+ certified headset.

Signature features

The Sony Xperia™ SP LTE comes with a range of features as standard. Below is a summary of the key signature features.

Xperia™ Local connectivity

More control over your media

Using Local connectivity, you can exercise more control over how media files get transferred and stored.

Xperia™ Home screen application

The place you call Home

Customise your Home screen with widgets, shortcuts, folders, themes, wallpaper and other items.

Where's best for you? Email top right? Music player bottom left? You decide. With six extensions to your Home screen, you've got plenty of space to put things where you want. Just remember to flick left or right to find them.

Xperia™ Socialife™*

Use the Socialife™ application from Sony to get your favorite news, videos and social networking feeds in one place. The Socialife™ home screen gives a clear overview of friends' Facebook™ and Twitter™ activity, plus news feeds that you have subscribed to. It colour-codes and sizes articles for easy reading, adding photos and cropping images of your friends' faces to illustrate each story.

Positioning – location based services

Supported standards:

- OMA Secure User Plane Location (SUPL) v1.0 & v2.0
- 3GPP™ Control Plane location
- Qualcomm® GPSOneExtra™

Supported satellite systems:

- GPS
- GLONASS*

* **NOTE:** GPS and GLONASS are used together to calculate the position. Positioning is more robust and accurate in most conditions, if both systems are active. The benefits of using GLONASS are automatically available for all applications using the Satellite Positioning API (referred to "GPS Provider" in Android terminology).

Provisioning (OMA CP)

OMA CP version 1.1

Multimedia (audio, image and video)

Audio Playback	Decoder format	Supported in file format
	MP3	MP3 (.mp3), AVI (.avi, .xvid)
	AAC LC, HE-AAC v1, HE-AAC v2, AAC ELD	3GPP (.3gp), MP4 (.mp4), MKV (.mkv), MPEG-TS (.ts)
	AMR-NB, AMR-WB	3GPP (.3gp)
	General MIDI (GM)	SMF (.mid)

Memory in Android™ phones

To use Android phones efficiently, users should be aware of the different types of phone memory. This knowledge is important in order to understand, for example, where music, photos and videos are saved; how many apps can be downloaded from Google Play™; and how photos can be copied to a PC.

The below information is also of interest to developers who wants to make their programs able to make the best possible use of the resources in the phone.

Generally, all Android phones share the same basic memory setup. What differs is how much memory is available to you via the different types of memory, and whether your phone uses an external SD card or an internal memory chip. Any information specific to the particular phone model described in this White Paper is noted as such.

Types of memory

The types of memory described below are consistent with the terminology used in Sony mobile phone menus and in other content relating to 2013 Xperia™ phones:

1. **Dynamic Memory** (also known as RAM) is used by applications that run when the phone is turned on. The amount of Dynamic Memory influences how many applications and operating system services can run at the same time. In Android™, the operating system automatically closes applications and services that are not being used.

However, such automatic functionality has limits. For example, if a lower amount of free RAM is available to applications after a new release of the operating system (due to increased capabilities in the system), phone speed will eventually be impacted (this is the main reason that a certain device cannot be indefinitely upgraded to newer releases of Android™).

If you experience problems with RAM, for example, if the phone runs slower than usual or if the Home application restarts frequently when you leave an application, you should minimize the use of apps that run all the time. Such apps could include, for example, applications that frequently download social service updates. You could also consider using a static wallpaper instead of a live wallpaper.

To see which apps and services are currently active, go to **Settings > Applications > Running Services**. You should have at least 50 MB, and ideally 100 MB or more, of free RAM to avoid slowdowns and application restarts.

You should also be aware that if you update the phone to a later Android release, the load on the built-in Dynamic Memory will increase due to the addition of more features, as mentioned above. As a result, the phone may run slower after an update.

2. **System Memory** (also known as “System partition” or “/system”) is used for the Android OS and for most applications that are pre-loaded from the factory. This type of memory is normally locked, and can only be changed through a firmware upgrade. There is usually some free space available in this section of memory. However, since it is locked, you cannot save apps, photos or any other content to this memory. System Memory is reserved for future firmware upgrades, which almost always need more memory than the original firmware. You cannot see or influence the use of this memory.
3. **Internal Storage** is memory used as “working” memory. It can be compared to the C: drive on a PC or to the startup disk on a Mac.

This memory is used to store all application downloaded from Google Play Store™ (and other sources) and their settings and data (such as emails, messages, calendar events and the like). All applications have an allocated area which no other applications can access and where the application data can be

stored.

Some games also store content such as game music and level information outside their own designated area; and generally, any application can choose to save their data in locations of their own choosing (outside the protected application settings areas). Generally, such content is not deleted when an application is uninstalled but must be removed manually, by connecting the phone to a computer with a USB cable, or by the use of a file manager application.

Internal Storage is also used for all user content added, for example, as a result of the user taking photos with the camera, downloading media files, and performing file transfers. Typical user content includes:

- photos
- movies
- music
- downloaded documents (as email attachments, for example)

Internal Storage will tend to fill up as a result of normal usage: use of applications saving their data, downloading and installing new applications, downloading free or bought content and taking pictures and movies. Therefore, the larger this memory is from the start, the more applications you can download and use, and the more pictures and movies you can take.

If the Internal Storage starts to get full, the phone slows down, and in some cases it might no longer be possible to install more apps. You should always ensure that you have at least 100 MB of free Phone Memory. If not, you should consider removing some apps that you seldom use, or move content you do not frequently access to safe storage.

You can see approximately how much Internal Storage is free in **Settings > Storage > Internal Storage**. You can also view more detail about how much memory is used by applications in **Settings > Applications > Manage Applications**.

Please note that in Sony Mobile 2013 products, “Internal Storage” is now the union of what was previously known as “Phone Memory” (for applications and their data. “/data”) and “Internal Storage” (for user’s content, “/sdcard”). The reason for this change is to make the use of available memory more flexible, and also to enable the optional encryption of user’s content.

Memory card slot

In some products you may find both a large internal memory and a memory card reader slot. However, on the current Android platform, the card reader slot does not work in the same manner in a phone with large internal memory, as in a phone with ONLY a memory card slot.

Generally, since most applications expect only a single location of storage, such applications will not generally allow you to SAVE anything to the card (i.e. they will lack an option to choose storage location); however, some applications (for instance, the Sony Mobile “Camera” application) may actually allow you to do so. Other, for example backup applications such as the Sony Mobile “Memory” application, will by definition be configured to copy content from the Internal Storage to the external SD card.

On the other hand, when it comes to READING from an external SD Card, you will be able access content (videos, photos, music) on a memory card inserted in this slot without any special considerations since the Android system searches all available memory for content. Therefore, such products may be regarded as supporting a fourth type of memory, called “External Card”.

4. **SD Card** (known as “/ext_card” from a programmer’s point of view, or by other names in other Android products) is the name for the removable SD memory card in all 2013 Sony Mobile products. As described above, this External Card memory is generally more limited in that any application can READ from it, but many applications cannot SAVE to this card. Only a few applications, including back-up applications and file manger applications, has the capability to save to this card.

Backing up data to different memory types

Generally, you should not save photos, videos and other personal content solely on the internal memory of a phone. If something should happen with the hardware, or if the phone is lost or stolen, the data stored on the phone’s internal memory is gone forever.

In a phone where an SD card reader is the main memory, it is relatively easy to take the card out and copy all content to a PC or Mac, or to an entertainment device with a memory card slot. In a product featuring Internal Storage as the main memory, it is not possible to physically remove the memory. Instead, any critical or high-value content must either be copied to an external SD card by a special backup application, transferred to remote storage over a network (mobile or Wi-Fi), or to a computer via a USB cable.

To facilitate the transfer of data via a cable, the Xperia™ SP supports the Microsoft standard, Media Transfer Protocol (MTP), which makes it possible to easily transfer content back and forth between your phone and a Windows PC. For Apple Mac computers, a special application, BridgeforMac, is available offering built-in support for MTP; this application can be downloaded from the Xperia™ SP Support page.

Note that you do not need to back up or make a copy of applications that you have downloaded from Google Play™. They can normally be downloaded again if, once you have set up your Google account to work in a new phone (or a phone where the memory has been completely erased).

Note 1:

As noted above, some Android phones, including Sony Mobile devices from 2012, and Sony Ericsson devices from 2011 and earlier, do not use a single “Internal Storage” for both applications (and their data) and user content. Instead, these devices use either an external SD card for user content, or a corresponding area of internal memory to reproduce the functionality of an SD card. In such devices, there is a fixed limit between the application area (“/data”) and the user content area (“/sdcard”); with the result that user content can be filled, stopping the taking of new pictures for example, while there is still considerable free space in the application area; or vice versa, stopping the download and installation of new applications even though there is free memory in the content area.

Note 2:

Some devices with an integrated storage have abandoned the distinction between the application area and the content area when it comes to Factory Data Reset. As a result, there is no choice to do Factory Data Reset and preserve content; in such devices, all content is mandatorily and completely deleted from the device when a reset is performed.

In contrast, Sony Mobile has done the integration in a manner which makes it possible to preserve user content in this situation; therefore, when performing a Factory Data Reset, the default will still be to only remove applications and their data, and an option box must be checked if also all content is to be removed (as might be desirable when selling the device second-hand, for instance).

Note 3:

For a developer, it is important to note that from a programmer’s point of view, the location names used to refer to the different memory areas described in Note 1 are still valid; i.e., the area used for application (/data) is still present, as is the area used for content (/sdcard).

In reality, “sdcard” is a so-called symbolic link to “/data/media”, but from inside an Android application, “/sdcard” can still be used (for instance, use “sdcard/DCIM/100Android” to find all camera images). Continuing to use /sdcard to access the content area ensures compatibility across different products and Android releases in this regard.
